DISSERTATION ABSTRACT

STATEMENT OF THE PROBLEM

Main Problem

The study attempted to identify the factors which may be related with success in small-scale industry entrepreneurship in Thailand and to analyse their relationship with indicators of entrepreneurial success.

Sub-problems

Specifically, the study was designed to answer the following questions:

1. What is the profile of the entrepreneurs of small-scale business in terms of
 - 1.1 Their personality traits
 - 1.2 Personal and family-related factors
 - 1.2.1 Education
 - 1.2.2 Business experience
 - 1.2.3 Family background
 - 1.2.4 Family support

DE LA SALLE UNIVERSITY

2. What are the perceptions of the entrepreneur respondents concerning the following business-related environmental factors surrounding their operations?

- 2.1 Business conditions
- 2.2 Competition.
- 2.3 Government support.
- 2.4 Location of their business

3. What is the profile of the small-scale industries included in the study in terms of

- 3.1 Returns on equity
- 3.2 Number of employees
- 3.3 Number of product lines
- 3.4 Number of outlets/branches
- 3.5 Rate of reinvestment
- 3.6 Annual net income
- 3.7 Value of net worth
- 3.8 Income tax

4. Is there a significant relationship between the set of independent variables: entrepreneurs' personality traits, personal and family-related factors, business-related environmental factors, and each of the following dependent variables

- 4.1 Returns on equity
- 4.2 Number of employees

DE LA SALLE UNIVERSITY

- 4.3 Number of product lines
- 4.4 Number of outlets/branches
- 4.5 Rate of reinvestment
- 4.6 Annual net income
- 4.7 Value of net worth
- 4.8 Income tax

5. Which of the aforementioned independent variables are significant predictors of success in small-scale industry entrepreneurship in Thailand?

Procedure

The study used the descriptive-correlational method of research. It included the gathering and presentation of current information concerning entrepreneurship and small-scale industries. It also covered correlational analysis in determining whether or not a relationship existed between the independent variables: entrepreneurs' personality traits, personal and family-related factors, and business-related environmental factors and the dependent variables: returns on equity, number of employees, number of product lines, number of outlets/branches, rate of reinvestment, annual net income, value of net worth,

DE LA SALLE UNIVERSITY

and amount of income tax paid.

From the population of 10,868 entrepreneurs of small-scale industries, a stratified random sample of 313 was selected at a level of significance of .05 and an error margin of .10 standard deviation. The sample consisted of 112 respondents who returned the completed survey forms. They were distributed as follows: 60 from manufacturing industries, 38 from service industries, and 18 from handicraft industries.

The data-gathering instruments consisted of one standardized questionnaire and two other questionnaires developed by the researcher. The standardized instrument was the Edward Personality Inventory Booklet (1966) by Allen L. Edward which was used to identify the personality traits of the entrepreneur respondents. The second questionnaire was designed to gather information concerning the personal and family-related factors which were hypothesized to be related with entrepreneurial success in small-scale industries. The third questionnaire identifies the indicators of success in small-scale industries.

DE LA SALLE UNIVERSITY

Data Analysis

The entrepreneurs' personality traits, personal and family-related factors, business-related environmental factors, and indicators of success were presented in terms of frequencies and percentages. Multiple correlation and regression through stepwise regression were used to determine if there was a significant relationship between the personality trait factors, personal and family-related factors, environmental factors, and each of the indicators of success and to predict the indicators of entrepreneurial success in small-scale industries.

DE LA SALLE UNIVERSITY

Findings

Following are the significant findings of the study:

1. Profile of Entrepreneur Respondents

1.1 Personality traits

Self-centeredness, motivation to succeed, ability to plan work efficiently, assuming responsibility, being a hard worker, and feeling superior were the dominant personality traits of the majority of the entrepreneur respondents.

1.2 Personal-related factors

1.2.1 Although some of the entrepreneurs had college education, almost half of them completed primary or secondary education only. The majority pursued college education which had nothing to do with business.

1.2.2 Almost half of the entrepreneurs were new

DE LA SALLE UNIVERSITY

in business having operated their business for less than five years. The majority of them had previously been engaged in business enterprises which were related or exactly the same as their present business.

1.2.3. The fathers of the majority of the respondents were employees whose work had nothing to do with business management or operations. About one-third of the entrepreneurs whose fathers either owned or operated their own business started business lines which were completely different from those of their fathers.

1.2.4 Almost all of the entrepreneurs received high moral and financial support from their families.

2. Perceptions of entrepreneur respondents of environmental factors affecting their business.

2.1 As a whole, the respondents perceived the general business conditions of Thailand as favorable or conducive to their business.

2.2 Competition was perceived by the majority of the respondents as low.

DE LA SALLE UNIVERSITY

2.3 Support from the government was perceived as low.

2.4 The business sites of the entrepreneurs were described as accessible and slightly affected by floods.

3. Indicators of success in small-scale industries

3.1 The majority (61.8%) of the entrepreneurs had returns on equity ranging between 10% to 30%.

3.2 The majority (71.4%) of the small-scale business enterprises had 7 to 15 employees.

3.3 Less than half (36.6%) of the entrepreneurs concentrated on one product line only.

3.4 The majority (87.9%) of the small-scale businesses operated by the respondents had no other branches.

3.5 A little more than half of their businesses (50.8%) had rates of reinvestment ranging from 10% to 30%. The mean rate of reinvestment was 26.26% with a standard deviation of 25.18%

DE LA SALLE UNIVERSITY

3.6 The majority of the small-scale business entrepreneurs could make, on the average about two million baht of sale revenue per annum. The mean sale revenue was 9.1 million baht with a standard deviation of 31.3 million baht.

3.7 The mean value of net worth was 2.9 million baht with a standard deviation of 6.1 million baht. 3.8 The amount of income tax paid greatly varied ranging from 100 baht to 7 million baht. The mean was 174 thousand baht with a standard deviation of 765 thousand baht.

4. Correlates of Success

The most notable personality trait of the entrepreneur respondents was their ability to make friends easily since it was significantly related with three indicators of success, namely; returns on equity ($r=.55818$, $p=.0006$), number of branches ($r=.37688$, $p=.002$) and the rate of reinvestment ($r=.21245$, $p=.0245$).

The next most predictive factor was an

DE LA SALLE UNIVERSITY

environmental factor: business conditions. Business conditions was significantly related with value of net worth ($r = .26871$, $p = .0179$), and significantly related with number of branches ($r = .37688$, $p = .002$).

the other significant correlates of success were personality trait factors: being a hard worker which related with number of employees ($r = .28926$, $p = .008$), self-centeredness which was related with annual net sale ($r = .46725$, $p = .000$) and feeling superior related with amount of income tax ($r = .22301$, $p = .0181$).

Level of education was found significantly related with annual net sale ($r = .46725$, $p = .000$), while business experience was significantly related with value of net worth ($r = .26871$, $p = .0179$). Another environmental factor, government support, was significantly related with returns on equity ($r = .35818$, $p = .006$).

5. Prediction of indicators of success in small-scale industries.

Success in small-scale industries could be predicted with the use of the following regression

DE LA SALLE UNIVERSITY

equations:

5.1 Net sale revenues

$$Y = - 358082.8339 X_1 + 532659.84945 X_2 \\ - 1491770.237 X_3 + 73742502.189$$

where X_1 = self-centeredness

X_2 = level of education

X_3 = business location

5.2 Number of branches

$$Y = - .01931 X_1 + .03908 X_2 + .10348$$

where X_1 = ability to make friends easily

X_2 = business conditions

5.3 Returns on equity

$$Y = - .40848 X_1 + 1.12895 X_2 + 13.00027$$

where X_1 = ability to make friends easily

X_2 = government support

DE LA SALLE UNIVERSITY

5.4 Number of employees

$$Y = -.15629 X_1 + 24.86919$$

where X_1 = hard-working

5.5 Value of net worth

$$Y = 34311.33306 X_1 + 184970.70285 X_2 + 5060160.623$$

where X_1 = business experience

X_2 = business conditions

5.6 Amount of income tax

$$Y = - 6839.22074 X_1 + 520228.44181$$

where X_1 = feeling superior

5.7 Rate of reinvestment

$$Y = - .23178 X_1 + 36.98378$$

where X_1 = ability to make friends easily

8. Approximately 4.514% to 21.832% of the variance in the different measures of success in small-scale

DE LA SALLE UNIVERSITY

entrepreneurship could be explained by the given predictors.

Conclusions

Based on the findings of the study, the following conclusions were drawn:

1. The respondents possessed personality traits which were significantly related with successful entrepreneurship of Small-Scale industries.
2. Personal-related and environmental factors such as business experience, business location, business conditions and family support were conducive to the growth of the business of the respondents. Government support, however, was lacking.
3. Success in small-scale industries was independent of the family-related factors: nature of business and job of the fathers and moral and financial support of the family.
4. Since the predictors of success identified in the study could not fully account for the observed variance in the extent of entrepreneurial success of the respondents, there are other factors that can possibly explain why some entrepreneurs are more successful than the others.

DE LA SALLE UNIVERSITY

Recommendations

Based on the findings and conclusions of the study, the following recommendations are given:

A. Recommendations for future entrepreneurs

1. The findings of the study showed that certain personality traits were significantly related with success in managing small-scale businesses. Thus, those who consider entering into small-scale industries should strengthen those traits in them if they already possess those traits, or develop those personality traits if they find themselves lacking in them. Those traits are the ability to make friends easily, self-centeredness, motivation to succeed, ability to plan work efficiently, assuming responsibility, being a hard worker, and feeling superior.

2. It seems that entrepreneurs of small-scale industries received very little government support. Since government support is significantly related with business success as shown by the study, small-scale entrepreneurs should associate more and develop a

DE LA SALLE UNIVERSITY

closer relationship with government officials and authorities and seek more government support. There is also a need on the part of the government to extend greater assistance to small-scale entrepreneurs.

B. Recommendations for curriculum developers, teachers, and school administrators.

Education was found to be positively and significantly related with business success in spite of the fact that most of the respondents received elementary and secondary education only and that the few who had college education took non-business related courses. Thus, there is a need to provide an elective course in business in the secondary level for those who want to go into business after high school. The government may also offer intensive non-formal courses in small-scale industry management especially for the out-of-school youth.

C. Recommendations for future studies and research

The following may be undertaken as offshoots of the present research:

DE LA SALLE UNIVERSITY

1. An empirical validation of the indicators of success identified in the study;
2. A replication of the study which will focus solely on one type of small-scale industry so as to provide a more in-depth analysis of the correlates of success in small-scale industry entrepreneurship;
3. A study in the form of case analyses which will identify correlates of success and
4. Studies that will identify the factors of success which were not analyzed in the study.
