

ABSTRACT

Alcohol and drug addiction has two main components. One is a need to address a biophysical rehabilitation, for the reason that a person becomes trapped by the physical dependence and cravings for more of the drug. And two is the mental and/or emotional side, where the individual feels he or she needs the drug to function in everyday life. Either way it is the feeling that one must use the drug to continue to work. Despite the fact that the same substance they think is helping them feel better is actually killing them.

The development of the study come up with different ways and instruments, the gathering of data trough survey, interviews, related study, related projects and different research basis. Its development shows that there must be correct and great considerations especially on users and environment in planning an institutional occupancy.

"KASIMULA" a Philippine Drug and Alcohol Rehabilitation Centre will establish facilities that will help to restore the health and life of a drug and alcohol dependent. A person who is under of substance abuse that is willing to change and start a new meaningful life. The outcome of the study accomplished revealed that a need of such facility is prevailed in Laguna and this will be a great help not only on the region with high population of drug and alcohol dependent but also the site where the proposed rehabilitation will be located.

The study aims to control the problem which is our only solution although we may not beat or totally eradicate the issue but at least we have the equipment to control and hold the problem for a while. We claim these words for we knew that our society is in need, this may not be the first but this research will emphasize that we the society as well the government of our country needs more effort to completely ensure the safety of the next generation.

It also aims to touch and secure each other life or a man to man approach and involves the natural environment. The study ignores isolating people but attaching drug and alcohol dependent to start a new life. The design output shows the interaction of human and the environment where it has the realization that there must be the need of rehabilitation based on the current situation issues in drug and alcohol in the society.

The study has brought into life by the lines and concepts, the proposed study is found to be feasible and able to adopt changes to the needs of our time. The idea to convert or redefine the meaning and character of a rehabilitation centre into a more atmospheric, environmental friendly and free type rehabilitation centre was a great idea for we have escaped from the usual and foresee the function of the facility into a different but in a well effective manner. This study is made not to change or contradict to what we have for usual, it is made for us to see specially the government sector and medical sector that what we have for usual wasn't good enough anymore for what this study saw and used is a formula that could answer the problems not through usual manner or techniques only but a way that could also solve the problems through an unusual manner. And for that this study has succeed and proven effective for the health and mentality of the users.

However, this book will be requiring a follow up study and much deeper research to actually give help to our government and medical sector as the researchers pass the rights and honour to continue what the researchers have started or otherwise may be continued by the researchers themselves to make the study a hundred percent well efficient and effective.
