ABSTRACT

Leptospirosis is a zoonotic disease endemic in the Philippines. Rats act as maintenance hosts and contribute to disease transmission. Reports of human infection increases each year, suggesting the possibility that domesticated dogs could also be reservoir hosts in the Philippine setting. A prevalence study was conducted using 152 urine samples obtained from either pure breed or mixed breed dogs found in Bacoor, Dasmariñas, and General Trias. Extracted DNA was assayed for pathogenic leptospires by PCR amplification of *lipL32* gene. Results showed the total prevalence was 2.63%, with 3.77% in pure breeds and 0% in mixed breeds. Using statistical analyses, it was found that there is no significant difference ($p > 0.05$) between pure and mixed breeds dogs in relation to risk of infection, and that a significant association ($p=0.0001$) between domesticated dogs and pathogenic leptospires exists. This would indicate that leptospiral infection is non-selective among breeds and that domesticated dogs may serve as sources of human leptospiral infection.

TABLE OF CONTENTS

Title Page	1
Approval Sheet	2
Acknowledgments	3
Abstract	4
Table of Contents	5
CHAPTER 1 INTRODUCTION	
1.1 Background of the Study	7
1.2 Conceptual Framework	11
1.3 Statement of the Problem	12
1.4 Scope and Limitations	12
1.5 Significance of the Study	13
1.6 Definition of Terms	13
CHAPTER 2 LITERATURE REVIEW	
2.1 Conceptual Literature	15
2.2 Related Studies	21
CHAPTER 3 METHODOLOGY	
3.1 Research Design	28
3.2 Research Setting	28
3.3 Research Procedure	28

3.4	Data Gathering and Statistical Analysis	32
CHAPTER 4 RESULTS AND DISCUSSION		
4.1	Results	33
4.2	Discussion	35
CHAPTER 5 CONCLUSION AND RECOMMENDATIONS		
5.1	Conclusion	41
5.2	Recommendations	42
Cited References		43
Appendices		
A.	Map of Study Site	58
B.	Standard Procedure	59
C.	Photo Documentation	65
D.	Gantt Chart	69
E.	Budgetary Requirements	70
F.	Curriculum Vitae	71
