ABSTRACT

Having a Mini grocery or General merchandise is difficult when using manual system for recording of products delivered by the supplier, listing down items to be purchased by the customer, tracking sales, and counting the remaining products. It is for this reason that the proponents proposed to create a Network-based Sales and Inventory system to lessen the work of the employees.

A generic Network-based Sales and Inventory will help the owner to keep track of their sales and inventory, and to monitor the fast moving products. The employees are the beneficiary because the manual pen and paper writing of receipt is eliminated with the use of barcode scanner and the software itself. The system includes the process of generating reports: Sales report, Inventory report, Delivery report, Accounts report, Fast and Slow moving report, and Returned products report. Security is also prioritized: username and password, and access level are included.

The proponents used Microsoft Visual Studio and SQL Server Management Server Studio in developing the system.
