

ABSTRACT

Computer Assisted Instruction on Basic Troubleshooting & Maintenance of Computers focuses on computer hardware like monitor, printer, system unit, diskdrive, mouse, and keyboard, which are conventional parts of the computer. It specifies the description, maintenance, and troubleshooting of computers and can be accessed by means of clicking on the buttons on what source of information to find and with its specified hardware.

It was developed to give information on conventional computer hardware. Each one having description, troubleshooting, maintenance and if any, some precautions on troubleshooting. The MS Powerpoint was used to present the process.

In this study, suitability of these can be found in less average users of computers due to its hardware limitation, average user can skip the component recognition and proceed already to the checking, testing and maintenance to these parts.

The proponents recommend further improvements on the graphics and sound system to greatly interest the user and some animation that can encourage the learning process for beginners. One can make necessary improvement if they choose to, there are no restrictions for improvements.
