

ABSTRACT

Family Express Lending (FEL) started as a small business and as the business grows, so are the needs for efficiency, reliability and safety of its records. These problems are the main concern of the researchers. Because of these, the researchers chose to automate the present manual system of FEL.

The researchers used many references to create an automated transaction system. These references were used in order to attain efficiency and reliability of FEL records. The researchers have given FEL personnel and managers the necessary information, for them to have an overview of what kind of system the researchers would create, how the system can aid FEL's daily transactions and who would benefit from the said automated system. The scopes and limitations of the automated system were also elaborated. Even materials needed in the system development such as software and hardware specification were identified. Cost of the system development and the return of investment or the time for FEL to profit from the said automated system were also given consideration. Recommendations and conclusion for the next researchers were also elaborated to aid them. Training for the system end-users was also stated.
