ABSTRACT

Title: APPLICABILITY OF THE DEVELOPED
COMPUTERIZED ENROLLMENT SYSTEM FOR
SELECTED PRIVATE BASIC EDUCATION SCHOOLS
IN TANZA, CAVITE

Name of Institution: Adamson University – Manila

Researcher: Maria Gloria C. Abad

Degree: Master in Information Technology

Date Started: June 2003

Date Completed: March 2004

No. of Pages: 88 pages

The computerized enrollment system for selected private basic education schools in Tanza, Cavite was developed in response to the problems encountered in the existing enrollment system. The researcher went through a detailed and thorough investigation initially by observing the existing enrollment system. In addition, numerous interviews were conducted not only with the potential users but also with other schools' registrars and accounting clerks to collect different enrollment practices and to come up with current applicable computerized enrollment system that are suitable for the users.

Specifically this study sought answers to the following questions:

1. What is the profile of the respondents in terms of:
 - a. school affiliations
 - b. position in the school
 - c. years of service in the school

2. How applicable is the developed enrolment system for five (5) selected private basic education schools in Tanza as perceived by the respondents in terms of :
 - a. inquiry and reservation system
 - b. admission system
 - c. payment system
 - d. report-generation system
3. How do the perceptions of the respondents differ as regards the applicability of the developed enrollment system when grouped according to their profile?
4. What recommendations or suggestions were given by the respondents to improved the developed computerized enrollment system?

The instrument used for collecting data was a set of questionnaire. Questionnaire's was lifted from some thesis and from other System Analysis and Design books. The sample of the study consisted of fifty (50) respondents from the five (5) selected private basic education schools in Tanza.

After the data was gathered from the respondents, the SPSS program was employed to analyze the data. The descriptive statistics which includes the frequency, percentage, arithmetic mean, standard deviation, one way ANOVA, LSD follow-up test and Scheffe test were used respectively to test the hypotheses and the follow-up test for this study.

The following conclusions were drawn by the researcher based on the findings gathered:

1. Based on the assessment of the respondents, the system was highly applicable. Therefore, the developed computerized enrollment system was functional and can be of great help during enrollment.
2. The developed computerized enrollment system was highly applicable to concerned offices which are the Registrar and the Accounting offices.
3. The profiles of the respondents were grouped according to their school affiliation, positions in school and numbers of years of service in the school. They assessed the applicability of the developed computerized enrollment system using the four modules of enrollment system namely: the inquiry and reservation system, the admission system, the payment system and the report-generation system. They are perceived to be "highly applicable."
4. There was no significant differences on the perceptions of the respondents when they are grouped according to positions in the school and according to number of years of service in the school.
5. Since there was a significant difference on the perceptions of the respondents when they are grouped according to school affiliations the null hypothesis was rejected. The developed computerized enrollment system was highly applicable in four of the five schools and applicable in one of the five schools. Therefore, the developed computerized enrollment system can be used for better and improved enrollment transactions.

6. Based on the recommendations and suggestions of the respondents for the developed computerized enrollment system, the researcher add exit button to some dialog box that do not have exit icon, resized the icons appropriately on the screen size, and modify the font sizes and font colors accordingly to the theme of the school.

Based on the findings and conclusions of this study, the researcher presents the following recommendations:

1. The school administrators should consider integrating the four subsystems of enrollment namely: inquiry and reservation system, admission system, payment system and report-generation system.
- ✓2. The school administrators should consider adapting the developed computerized enrollment system for their planning, forecasting and decision-making.
3. The administration personnel, as forefront in school offices, would be able to reduce their paper works such as preparation of summary of enrollment activity.
4. The developed computerized enrollment system was highly applicable. The respondents can use it in processing the enrollment of their current and prospective students.
- ✓5. The developed system can be used as an improvement/replacement of the existing semi-automated enrollment system to speed-up the processing of students enrollment.

6. The future researchers can consider this study as a basis in developing computerized enrollment systems.
