ABSTRACT

In CDI Sakata Inx, there is a need for a performance that will let the organization be as efficient, as reliable and as fast as it can be. In the course of studying the old system proponents came up with a conclusion that Manual Processing of payroll system, which is used by the firm, gives no assurance that the integrity of data will be maintained. Moreover, there is a lack of necessary controls making it more accessible to fraud and errors. In compliance to the problems regarding manual Payroll System, this thesis intended to develop a Payroll System Requirement. This will provide an easier, more efficient and convenient payroll processing.

In this study, the researchers used the "Prototyping Method" in order to study well the existing system and to come up with a new system suitable for the company. The new system will yield very fruitful gains not only for the Finance Department but also to the entire employees. Proper distribution of wages makes workers happy. Happy workers produce very fine goods. Very fine goods attract and gain more and more customers. More customers means increase in financial state. High rate of financial status means success. Success means PROGRESS FOREVER. Thus, this system will definitely meet the goal of the company putting them in the height of success.
