ABSTRACT

The Imus Institute Enrollment System is established to solve the problems encountered by Imus Institute during enrollment. These problems include the long lines that are encountered during enrollment, large amounts of paper work for the Registrar's Office due to the large population of the school. The files take up too much space and are prone to destruction and loss. The transaction process is very slow, tedious and takes a lot of time to be accomplished.

The method used to develop the system is the Systems Development Life Cycle (SDLC) where each phase should be finished first before proceeding to the next.

The proposed system provides solutions to most of the problems encountered by the school. It makes transactions and processing of files faster thus also making the lines shorter, there is an easier means of manipulating, storing and retrieving information, the files are less prone to destruction and loss and the storing of files do not take up large spaces.

It is recommended though that the system be networked so that there is no need for constant updating of the databases every now and then.
