The increasing number of users and reference materials of Holy Rosary Academy Library contribute to a poor productivity of the librarians. At present, HRA-Library has only two librarians who carry out all library activities versus a thousand and five hundred students, sixty five faculty members and almost one hundred fifty transactions a day. Most of the time, some activities were neglected just to be able to accomplish the tasks that needed immediate attention like assisting the borrowers with payment of fines and helping the users search the book. The Book Cataloging was left unorganized by the former librarian who did not follow any of the scientific book classification systems. Because of this, the librarians had to reassign the appropriate Call Number of books while attending to their daily duties. The physical files of HRA-Library lack security that causes data loss and inconsistency thus producing unreliable information. The school management suggests that it's about time to adapt to an automated library system without having to spend a big amount of money. The proponents of this study proposed to develop an automated library system to be able for HRA-L to meet its specific needs for quality service. This study enhances our knowledge and skills in the field of Computer Studies.
