

ABSTRACT

FISHBALLOTCOM Time Monitoring and Billing System is developed to accurately monitor Time and Billing transactions of its customers. The current system is paper-based and performs manual operations that are prone to miscalculations resulting to accumulative income losses.

The Prototyping Methodology was used in developing the system. Requirements were converted to a working system that is continually revised through a close work between analyst and user.

It is recommended that in order to arrive at the improvement or enhancement of the system, installation and implementation should be supported by an upgraded Operating System so as to cope up with changing of time.
