Abstract

Ramson's Export International Inc. performs its payroll system manually. The payroll computation of Ramson's gives problem to the Accounting Clerk, Department payroll Clerk and to the employee's. It would take them much to finish different workloads like finding employees' record, files and their salary computation.

For these reasons, Ramson's Payroll System was created by the proponents in order for the company to have a better way in computing their payroll. The system includes computerizing their manual tasks such as record keeping and computing their payroll. The advantage of the system is to set – up, update, and retrieve data items from an organized database. This will also help them track the employees' progress. Another advantage of the new payroll system is generating the payroll slips, which will be printed out by the computer and other forms included in system. The system also boasts of security maintenance so that limited people will only be given access to the files.

The proponents make sure that the system would be user friendly, making the company's current manual system better and more efficient with the use of computers.
