

## ABSTRACT

The Product Monitoring System for Coolmate Corporation was developed to replace the manual system that updates the in and out of the products that Coolmate Corporation is handling. With the enhanced features of the proposed system, the generating of the daily and monthly reports will be made easy and accurate. Also, updating the supplies of the main branch will not consume a lot of time for the Parts Man because of the help of add, edit and delete commands. The proponents ensure data integrity that is useful for the transactions and record keeping of the company. The system has enhanced features that are user-friendly, accurate and efficient enough to handle the transactions in terms of product monitoring. Having a computerized monitoring system for the company enables the company to be more profitable and at the same time this system helps to ease the load of work for the users especially the Parts Manager who is in track of monitoring and generating the daily sales of the company.
