

CHAPTER 7

CONCLUSION AND RECOMMENDATIONS

The computer industry continues to grow. Each day many new discoveries and inventions are being made. Side by side with this the networking industry grows and with this growth comes new problems that may arise. Thus creating a management system to aid the industry is such a big help.

Requirements analysis was the first step the proponents did to understand more the system creation and underwent a number of interviews with the client and possible users of the system. The proponents also did research on system development and design. Consultations with some programmers and system analysts are also taken into consideration in the study. With these they were able to see the problems encountered by the client with their existing system and eventually found a solution that would cater to these problems,

The proponents believe that the management system for Dreamhub Computer Center should feature some measure for the end-users which are the customers, the operators and managers. Everything is built for the intention of solving the problems encountered by the computer establishment and was based on the requirements that were analyzed and put into consideration. Computer relative information and printouts are also included to improve the processes in the system. This system will surely help the shop personnel every a monitoring is done.

Upon completion of the study, the proponents conclude that it is such a tedious task and not easy even if it looked otherwise. Creative minds, patience and serious understanding of the present system proponents underwent to develop an efficient management system that would aid the business.
