## **Chapter VI**

### **CONCLUSION AND RECOMMENDATION**

#### **Conclusion**

The problems that caused the delayed output in the 5 gallons in the production line do not come from a single source only. The delayed is caused by several factors, these are: Lack of workers, Disorganize of working place especially when noon time because they find a place were they are comfortable to work and the insufficient materials. On the other hand, these factors cause bigger problems in the future if not prevented. Effects can be production inefficiency and poor productivity. Hence, the alternative courses of action are chosen because these can help minimize the number of delayed output in production line.

#### **Recommendation**

After analyzing the problem and the alternative courses of action, it is strongly recommended the implementation of all alternative of action which are training/seminar of the workers about the significance of their task and their time, Hire additional workers for one pass washing and the set production quota & close monitoring by the supervisor since it can help the company to get the target output and minimize the factor that can affect the target output, so they will be free from delayed output. Although it is very time consuming, it is also very effective.
