CONCLUSION AND RECOMMENDATION

Through this study, the researcher was able to see that the safety of the workers are not met. In fact, the company has inadequate provision relative to the safety of the workers.

This study states that one of the problems of this company is encountering unsafe conditions and the workers cannot work with proficiency because of being cautious of the things surrounding them and because of inadequate protective gears. The researcher constructed different alternatives that are possible to meet the safety of the workers. So the company can also have an idea on how to better protect its workers and, shows also how important safety is because the one concerned here are the workers and they are the ones who are operating the machines. Without the workers, machines are useless.

The researcher recommends the first alternative. It will be better if the company to provide enough personal protective equipments, posters and signposts to make the employees more aware of their position and protected against accidents that might take place. This would avoid the workers of being too cautious in doing their actions and do their job more efficiently. This study only shows possible solutions and the decision still depends on the management of the Coca Cola Bottlers Philippines, Inc.
