VIII.	Conclusion	37-39

**CONCLUSION:**

As we have stated earlier, in one of the objective that this program intends to answer the increasing supply of protein in the community than it only shows that this project concern mostly on people and therefore it has social value.

The proponents also want to help the government as an industry. It will help to enhance and also to upgrade the status of it in the community by developing some technique and know how to be inducted to selected people who are interested in it.

In addition, it will also support the suppliers of foods and other materials that are to be needed in our projects.

And most especially it will afford a chance for some people to earn a livelihood persons who are employed by the proprietor, thus mitigating the unemployed problem. As a whole, it is one small step towards countryside economic development.

Resolving the problem of economic deficiency, we think that this kind of business will uplift economic development because it will promote food production and lessen unemployment. It will increase Balut, Salted Eggs as well as production of meat and encourage employment for the jobless.

With regards to profitability of the business, we think that it is highly recommendable to those people who want to invest their capital. Considering and analyzing its financial profitability, it is a highly productive investment because it will only takes five (5) months or more to cope up with its capital (see payback period) and as high as 238% for return on investment (Net of Return).

We therefore believe and conclude that this kind of business will lessen although not ultimately solve the economic crisis, our country is suffering today.
