Abstract

"The Online Computer Aided Instruction for C#" is an online tutorial system that covers Chapter 1 to Chapter 9 of the Microsoft Technology Associate (MTA) review kit for C#.

Students find chalk and talk type of teaching boring, that causes them to put their attention to other things; but with the fast changing technology, this situation can be avoided. This gave the proponents the objective to make the "Computer Aided Instructions for C#" where the students will avoid getting bored from the traditional way of learning, instead discover a new way of learning using a computer aided instruction, where there is a user interface environment provided that the students will enjoy and learn their subject at the same time.

The "Online Computer Aided Instructions for C#" was developed through gathering of information. C# .NET was the primary language used by the proponents in most part of the system. The proponents presented the system to the subject coordinator of C# MR. Jayson Sabale and IT/CS students to test the overall functionality of the system, as well as to know their feedback regarding the system. In the final results in testing the system, it only showed that the system got the satisfaction of the users in the system. The system was well accepted by the students, professors, and subject coordinator of DLSU-D, based on the results.
