

**THE PREVENTIVE POTENTIAL OF NATURAL GREEN TEA
DECOCTION VERSUS COMMERCIAL GREEN TEA ON
ALCOHOLIC LIVER DISEASE IN ALBINO RATS**

(Rattus norvegicus)

ABSTRACT

Alcohol intake has become one of the leading causes of liver damage resulting to alcoholic liver disease. Blood contains the enzymes alanine amino transferase (ALT) and aspartate amino transferase (AST) upon which the levels rise in the presence of liver damage. There have been numerous methods offered to counteract alcohol's effect on the body, one method of which is green tea intake. Green tea contains antioxidants that have been said to have a curative effect on liver damage and lower the expected rise in ALT and AST. In this study, 36 male albino rats divided into four test groups were acclimatized for two weeks. Each organism was subjected to cardiac puncture to procure samples for the Spinreact™ kit to determine the normal AST and ALT levels of rats. A spectrophotometer was used to read to absorbance of each sample. After the two-week period, the first group, T0-, which was composed of 9 rats, served as the control group and normal feeding was maintained. In the second group, T0+, liver damage was induced by administering ethanol daily for also two weeks. The third and fourth groups were also administered with ethanol; however dosages of natural and green tea were used as treatments that were expected to maintain low levels of ALT and AST. After the mentioned allotment of time, blood samples were once again taken to determine whether the two preparations of green tea had a curative potential and find out which preparation was more effective. The rats were then sacrificed in order for their livers to be removed and weighed, to resolve whether liver weight was significant in liver damage. One-way Analysis of Variance (ANOVA) and the Tukey Method were employed to compute for the gathered average ALT values of -0.0030, 0.3560, 0.0745, and 0.0854 (in order of the four treatments) were obtained, as a result of the difference between the initial and final extraction. The AST levels on the other hand were 0.0041, 0.4208, 0.2149, and 0.2818 respectively. Based on statistical data, both ALT and AST were indicators of liver damage. Natural and commercial green tea were both effective in maintaining low ALT and AST levels, however, the latter provided more highly significant results. Liver weight did not show any significance as an indication of liver damage.
