

## **Abstract**

Nowadays, Modern technologies are beneficial in making one's business successful. An online sales and inventory system is proposed to LA&E Home Enterprise to provide and advantage over their competitors. The system should improve the business process and transaction by saving time, eliminating redundancy, a database for handling large amount of important data and lessening the errors in storing and gathering data.

The proponents used PHP and V-model methodology in developing the system. The proposed system aspires to increase sales, improve customer service, as well as product services. And the system assures a fast and secured transaction for the customer's satisfaction.
